

Abstract of the Disclosure

A system and method for communicating data between a user and a receiver over a telecommunications network is disclosed in which the data relates to filing information for applications relating to the protection of intellectual property. The method includes the step of the receiver initially registering the user to communicate the application data over the network to the receiver. Thereafter, the user transmits data to the receiver relating to the intellectual property application via the network. The receiver verifies the completeness of the transmitted data from the user and, thereafter, confirms receipt of the verified data over the network to the user.
